PROFESSIONAL SUMMARY

Full-stack developer and AI agent engineer shipping production apps end-to-end — RAG pipelines, agentic systems, and computer-vision automation. Freelances solo for international clients, owning architecture, communication, and delivery end-to-end.

PROFESSIONAL EXPERIENCE

Freelance Full Stack Developer

Mar 2026 – Present

- Building a 2D touch-input framework in Unity 6.3 LTS for a Japan-market client targeting DLsite — per-character affection/excitement parameters, fill-bar UI, staged event system, and architecture iterated on client feedback, communicating directly in Japanese. [GitHub](#)
- Built two paid iOS game-automation bots — a Triumph.gg blackjack bot ([GitHub](#)) using computer vision for card/state detection, and a word-link solver ([GitHub](#)) using OpenCV template matching and DFS — \$250 each.

Full Stack Developer Intern — LevelUp Labs

Sep 2025 – Dec 2025

Hyderabad, India

[GitHub](#) | [Live Site](#)

- Contributed to the development of a structured learning platform that organizes YouTube educational content based on user learning goals.
- Implemented authentication and user management using Clerk.
- Integrated Supabase as backend infrastructure and database solution.
- Improved UI/UX and implemented progress tracking features for learners.

PROJECTS

SelfHeal *Next.js · TypeScript · Groq · OpenAPI · Tailwind CSS*

[GitHub](#) | [Live Demo](#) | [Watch Demo Video](#)

- Self-correcting API agent — turns a plain-English goal into a real HTTP request against any public OpenAPI/Swagger-described API, executes it, and self-heals on failure by feeding the error back to an LLM and retrying (up to 3 attempts), streaming every attempt live to a terminal-style UI.
- Designed a keyword-based endpoint pre-filtering step to keep large specs (e.g. GitHub's 1,220-endpoint API) within LLM rate limits — reduced a 252KB spec summary to ~3KB via position-weighted path/keyword matching before the LLM ever sees it.
- Enforced a strict execution boundary: the LLM only ever outputs structured JSON (method/url/headers/body); a fixed server-side fetch() is the sole thing that touches the network — no eval, no arbitrary code execution.

Across – Browser Memory Chrome Extension (Manifest V3) · RAG · pgvector

[GitHub](#) | [Watch Demo Video](#)

- Built a Chrome extension that continuously indexes open browser tabs and provides a natural-language chat interface grounded in the user's browsing history using RAG (Retrieval-Augmented Generation).
- Automatically tracks tab lifecycle events and extracts readable page content via Mozilla Readability, splitting pages into heading-aware semantic chunks with overlap.
- Stores vector embeddings server-side in PostgreSQL with pgvector, supporting multiple LLM providers (Groq Llama 3, OpenAI GPT-4o-mini, Anthropic Claude) and embedding providers (Jina AI, OpenAI, Hugging Face).
- Delivers source-cited answers grounded in content the user has actually viewed; works completely free using Jina AI embeddings and Groq Llama 3 with no credit card required.

Rasoori Rourkela – Home Cook Marketplace *TanStack Start · Supabase · Vercel*

[GitHub](#) | [Live Site](#)

- Built a full-stack marketplace connecting local home cooks in Rourkela, Odisha with customers seeking home-cooked meals, centered on weekly meal plans built around each cook's rotating menu — plan browsing, cart, checkout, and live order tracking, plus an admin suite for cooks to manage their menu and orders.
- Server-side rendered via TanStack Start with a Supabase backend (Postgres, Auth, Edge Functions, Realtime), deployed on Vercel.

EDUCATION

Manipal University Jaipur — Bachelor of Computer Applications (BCA)

2028

- Pursuing a flexible-format degree, allowing full-time availability for freelance work, internships, and full-time roles alongside coursework.

SKILLS

- **Languages:** TypeScript, JavaScript, Python, Rust, C# (Unity)
- **AI / LLM Engineering:** RAG pipelines, LLM integration (OpenAI, Anthropic, Groq), embeddings, voice pipelines (Whisper)
- **Frameworks & Libraries:** React, Next.js, TanStack Start/Query, Node.js, Express.js, Tailwind CSS
- **Databases:** PostgreSQL (pgvector), MongoDB, Supabase
- **Automation & Computer Vision:** OpenCV, WebDriverAgent (WDA), screen-capture pipelines, template matching
- **Game Development:** Unity 6.3 LTS, gameplay/event-system architecture
- **Security & Reverse Engineering:** API/auth flow analysis, traffic interception, MITM proxy debugging
- **Tools:** Git, Linux, Clerk, Vercel

ACHIEVEMENTS

- Winner — Hackathon at IIT Mandi
- Finalist — National Hackathon hosted by Jazzee Technologies at IIT Bhubaneswar
